Summary

AI Engineer with 4+ years of production software experience, now building LLM systems across RAG pipelines, multi-agent orchestration, and eval-driven development. Ships agents with guardrails designed in rather than added afterward, including role-scoped retrieval over clinical records and eval harnesses that gate releases on faithfulness to the source data. Shipped a RAG pipeline over 1,500+ patient records that saves clinicians roughly 8 minutes per consult, and a six-agent proposal system that cut a public-sector client's turnaround from 5 days to 2. Targeting AI Engineer roles building and evaluating production LLM applications.

Skills

LLM & Agents: LLM application development, Multi-agent orchestration, Agent runtime design, Prompt engineering, Function calling / structured outputs, Claude API, OpenAI API, Gemini API, NVIDIA NIM, Microsoft Copilot
RAG & Retrieval: RAG pipelines, Embeddings, Vector search (pgvector), Semantic retrieval, Sentence-Transformers, PostgreSQL, Supabase
Evaluation & Testing: LangSmith tracing and evals, Ragas, Rubric-based scoring, Faithfulness and regression testing, Pytest, Jest
Infra & DevOps: Azure, AWS, GCP, Docker, Vercel, Render, Power Automate, Structured logging, Application monitoring
Backend & Data: FastAPI, Node.js, Express, Pydantic, React, Next.js, TypeScript, .NET, PostgreSQL, MongoDB, Redis, REST APIs, Server-Sent Events, Microservices, System design, RBAC
Languages: Python, TypeScript, JavaScript, SQL, C++, C#

Experience

Minnodi LLC Baltimore, MD
AI Software Engineer *Nov 2025 - Present*

- Built a RAG pipeline on PostgreSQL and pgvector that retrieves only clinically relevant history from 1,500+ patient records and feeds Claude-generated pre-consultation summaries, saving doctors roughly 8 minutes per consult based on clinician feedback.
- Caught and fixed date errors, mixed-up patient history, and missing context in generated clinical summaries by iterating against Ragas faithfulness scoring and manual batch review, gating each release on faithfulness to the patient record.
- Implemented role-based access control across 4 user roles with a separate portal for each, and consolidated scattered paper and legacy records into a structured database, validating on dummy data before the client approved migration to real patient records.
- Built a six-agent proposal assistant on Microsoft Copilot and Power Automate for a public-sector client, centralizing a scattered SharePoint knowledge base so staff could find, summarize, question, and research documents, cutting proposal turnaround from 5 days to 2 across 8 proposals a month.
- Orchestrated agent-to-agent handoffs so agents could request data from one another, with file access checks on every handoff, integrated through the Microsoft Graph API.
- Built a case management platform for a counseling service in FastAPI, Node.js, React, and TypeScript, with an assistant built on OpenAI embeddings that retrieves and summarizes case history for 700+ clients.

RSM US LLP Bangalore, India
Software Engineer *Aug 2022 - Jun 2024*

- Engineered a role-based permissions API with 10 permission levels governing access for 1,000+ tax professionals across 1,000+ client accounts and 10 teams, replacing manual access handling and integrating legacy .NET services with a new Node.js and Express platform.
- Cut p95 latency from 480ms to 330ms on a shared permissions API used by 6 downstream microservices through backend refactoring and query tuning, measured in Azure monitoring.
- Owned design and Azure deployment of an employee transportation platform in React, TypeScript, Node.js, and Express with Azure SQL for RSM India's 5,000+ employees across five offices, replacing email-based booking and saving 80+ admin hours per month.
- Built three role-based portals for employees, admins, and the vendor, and implemented ride-pooling logic that grouped employees from nearby pin codes into shared cabs with live trip tracking.
- Led a four-person internal applications team, assigning and reviewing work, mentoring three junior engineers, and running a full knowledge transfer before departure.

Cognizant Technology Solutions Bangalore, India
Software Engineer *Mar 2022 - Jul 2022*

- Rewrote a slow transaction-data endpoint in Node.js for a global banking client's compliance team, replacing nested loops with targeted database indexing and cutting response time from roughly 6 seconds to under 1.5 seconds.
- Built secure REST APIs, efficient SQL data models, and Redis caching for 30-day transaction logs so analysts could pull heavy history without overloading the database, improving load speed roughly 40%.
- Built a React alerts dashboard with 15+ reusable components and client-side pagination and sorting, so analysts could review thousands of flagged transactions without lag, backed by Jest suites over the transaction parsing logic.

Schaffen Softwares Bangalore, India
Software Engineer *Aug 2020 - Jan 2022*

- Built the React UI for 5 client web applications, including a real-time fleet dispatch dashboard and an education portal, working across the full lifecycle from wireframes to client delivery.
- Pulled repeated data grids, navigation bars, and input tables into a shared library of 7+ core components adopted across 3 parallel projects, so developers stopped rebuilding the same UI.
- Stopped recurring app crashes from mismatched client inputs by adding schema validation on incoming API payloads, structured error logging, and Swagger documentation for client teams.

Projects

Keyfit, Multi-Agent Resume Tailoring Platform *FastAPI, Next.js, Python, NVIDIA NIM, LangSmith, Docker*

- Built a stateless six-agent LLM pipeline on NVIDIA NIM where each agent makes exactly one scoped call, with validation enforcing that every selected bullet traces back to the user's own profile so the tailor never fabricates experience.
- Designed a four-layer FastAPI backend separating routers, orchestration, agents, and external services, holding no database and storing user data in their own Google Drive with client-side encrypted API keys, behind a structured error contract carrying stage and trace ID so no raw exception reaches the user.
- Instrumented the pipeline with LangSmith tracing and rubric scoring, holding a 0.8 average rubric score across agents and pinpointing which agent regressed when output quality dropped.
- Engineered a pdflatex compile-and-verify trim ladder that checks page count with pdfinfo and progressively trims older roles to guarantee one-page output, streaming pipeline progress over Server-Sent Events. (github.com/sumanth-14/keyfit)

Kernel, Agentic SDLC Delivery Framework *Claude API, LangSmith, custom agent orchestration*

- Architected a delivery framework orchestrating 8 role-specialized agents spanning product management, architecture, development, QA, security, and DevOps across 3 phase-gated SDLC stages, reaching 93% workflow completion.
- Enforced mandatory human approval gates and a complete audit trail across phases, breaking each request into 20+ structured deliverables per cycle and scoring them in LangSmith.
- Designed an adaptive execution matrix routing 6 request types through different agent subsets, so a bug fix skips inception while a greenfield feature runs the full lifecycle.
- Published Kernel as both a cross-IDE agent skill and a Claude Code plugin with slash commands, drawing 30+ clones and 50+ unique visitors every two weeks. (github.com/sumanth-14/kernel-dlc)

We Zaap, AI Interview Simulator *React, FastAPI, PostgreSQL (pgvector), GPT-5.4, RAG*

- Co-built an AI interview simulator, taking it from a hackathon prototype to a React and FastAPI application generating role-specific question sets across 10 job roles for 50+ users.
- Grounded generated questions with a pgvector and Sentence-Transformers retrieval store returning context in under 200ms, and migrated question generation and answer scoring from GPT-4o-mini to GPT-5.4. (github.com/sumanth-14/WeZaap)

Education

University of Maryland, Baltimore County Baltimore, MD
Master of Science, Information Systems (GPA 3.85)

Dayananda Sagar Institutions Bangalore, India
Bachelor of Science, Computer Science (GPA 3.77)
